Research Experience

Research Activities

Sulphydryl reactivity of haemoglobins has been used as an indicator of both tertiary and quaternary structure in haemoglobin. Various haemoglobins from different animals have been giving diverse interesting results. The study has become very important because it reveals the in-situ structural changes in haemoglobins in solution, hence giving better details than the static crystal structure of x-ray diffractions. Recent experimental confirmation of the tertiary structural changes has widened the research scope of this study. This is a basic research without any immediate application but it will increase the understanding of the structural changes in proteins, hence understanding of the functions. I collaborate in this area of research with

- Professor K. O. Okonjo, A retired professor from University of Ibadan
- Professor Stefano Betatti, University of Parma, Italy.
- Professor Simonetta Croci, University of Parma, Italy
- Professor Alberto Luis Caparelli, National University of La Plata, Argentina.

Lipid transfer and membrane fusion in neurodegenerative diseases. Accumulation of lipids causes various diseases hence the need to regulate the synthesis, esterification, degradation and transfer of lipids from one vesicle membrane to another. A new method of assaying lipid transfer, which is better than the previous ones, has been developed. This has no significant effect on the chemical and physical properties of the lipids. A recent discovery however revealed that some of the lipid transfer has been by fusion. Research is presently being carried out on how to measure lipid transfer that has occurred by fusion and subsequently to separate it from the total lipid transfer. This research may become a basic tool in solving the problems of some neurodegenerative diseases. The work was expanded to include how lipids/polymers can form nanodiscs and how they can solubilise native proteins. I collaborate in this work with

- Professor Dr Konrad Sandhoff, University of Bonn, Germany.
- Professor Dr Sandro Keller, University of Graz, Austria/ Technical University of Kaiserlautern, Germany.
- Professor Dr Nicole Frankenberg-Dinkel, Technical University of Kaiserlautern, Germany.
- Professor Dr Michael Schlierf, Technical University of Dresden, Germany.

Environmental studies with special interest in kinetics, thermodynamics and isotherms of biosorption. This research is exploring the use of various waste biosorbents in the removal of heavy metals from water. The method is effective, safe and cheap; however there is a need for an in-depth research into the properties of the materials. There are still a number of indigenous biosorbents to be explored. Some of them are doped with nanoparticles or chemically modified for a better sorption/desorption capacities. The adsorption work was extended to the use of electrochemistry for adsorption of organic pollutants and water purification. This also led to catalytic dehydrogenation of organic compounds for environmental remediation. I collaborate in this studies with

- Professor Omotayo Arotiba, University of Johannesburg, South Africa.
- Professor N. Adesola Babarinde, Olabisi Onabanjo University, Ago-Iwoye.
- Dr Umesh Kumar, CSIR-Indian Institute of Petroleum, Dehradun, India.

- Professor Suman L Jain, CSIR-Indian Institute of Petroleum, Dehradun, India.
